

Vulcan Call For Access P1 2022-23

The following information provides guidance for the Vulcan experimental areas for the 2022-23 proposal call. It is recommended that you discuss your laser, experimental and diagnostics requirements with the appropriate CLF personnel prior to submission of your proposal.

Details on the Vulcan Laser can be found on the following link:

<https://www.clf.stfc.ac.uk/Pages/Vulcan-laser.aspx>

Contact: Ian.Musgrave@stfc.ac.uk

Contact: Rob.Clarke@stfc.ac.uk

Target Area West (TAW):

TAW can provide 2 main CPA beamlines - B7 and B8. B7 operates with an energy limit of ~100J prior to compression and a compressed pulse duration of ~1ps (N.B. The shortest pulse duration on recent experiments has been between 1.2 and 2ps). The compressed pulse can be increased in duration within reasonable parameters. B8 has 2 operating modes. Mode 1 has the same specifications as B7. Mode 2 operates at 300J prior to compression for pulse durations of 15ps or longer. Both CPA beamlines have a measured efficiency (July 2011) of 75-80% of the delivered laser energy when using standard experimental configurations. Standard F3 and ~F15 focusing are available.

B7 and B8 can be used in long pulse mode in conjunction with the long pulse inner track using a new compressor bypass. The exact specifications available are dependent upon pulse parameters and the required specifications should be discussed with facility staff.

The standard long pulse specifications (main 6) for TAW is unchanged. The maximum long pulse energies depend on the pulse duration. Indicatively each beam could fire 80J in 200ps, 175J in 500ps, 250J in 1ns or 280J in 6ns. The shape of the pulse could be shaped with a temporal resolution down to 100ps. The shot-to-shot jitter between the long and short pulse is currently $\sim\pm 170$ ps. Special configuration and/or pulse shape may reduce the available energy. It is recommended that shaped long-pulse requirements be discussed with facility personnel prior to submitting a proposal.
